For our analyses we have used the 4,836 dataset modified by the previously published data for the 19 previously characterized genes where we had different dispensability. This increased the number of essential genes from 1,249 to 1,260 and from this analysis dataset we conclude that 26.1% of fission yeast genes are essential for viability under the conditions used. Terms marked with an asterisk* are those enriched in the set of budding yeast essential genes but not in the fission yeast essential gene set, but where the differences are a result of annotation differences (i.e., the fission yeast genes are annotated to higher level terms), and not to biological differences. Most of these terms are enriched in fission yeast but the enrichment is below the 95% significance threshold. They are not significant biological differences. The number of essential genes is 1,260 from fission yeast and 1,033 from budding yeast. The total number of genes is 4,836 from fission yeast and 5,776 from budding yeast. The GO analysis is described in Methods in the main text. GO terms used to generate the data in **Fig. 2d** in the main text are cellular biosynthetic (process) (GO:0044249); cellular comp(onent) org(анизation) (GO:0016043); (nucleobase) nucleotide (nucleoside) & nucleic (acid metabolic process) (GO:0006139); RNA processing (GO:0006396); ribosome biogenesis (GO:0042254) ; protein localization (GO:0008104); translation (GO:0006412); mitotic cell cycle (GO:0000278); DNA replication (GO:0006260); general transcription (union of GO:0006360 , GO:0006383 and GO:0006352). Except where mentioned for transmembrane transport, all figures were taken from the enrichment data in **Supplementary Tables 5 and 6**. The terms used were selected to provide broad genome coverage of highly significant but also biologically informative terms.
